1. DOCUMENT INFORMATION

1.1. About this Guide

This guide provides technical information about integrating Allianz e-commerce platform (*eMagin*) insurance policy quotation and purchasing web services within the Business partner's (*B-Partner*) environment.

eMagin uses XML request and response messages which can be run on any platform and in any programming language. The messages are transported via REST over HTTP protocol.

1.2. Intended Audience

This document is a technical integration guide, intended for developers of B2B2C Business platforms, system integrators or other technical roles, including managers who are involved in designing sales data integration.

Required skills include XML, XML Schema, Web Services and application programming knowledge.

1.3. Related Documents

2. PLATFORM OVERVIEW

eMagin – Allianz e-commerce platform – provides an easy-to-connect API for B2B2C partner integration. The seamless technical interfaces provide a full transparent end-customer experience.

In this mode of online real-time sale (“Integrated”), the insurance offers are embedded into the partner’s web site, within the core offers booking path.

This document describes in both functional & technical terms the services *eMagin* offers:

- Quotation service: insurance quotation.
- Purchase service: insurance purchasing, with or without payment.

2.1. Quotation Service

Quotation Service refers to the real-time insurance quotation based on specific context. The context is often available once the end-customer has selected the core offer (i.e. airline ticket).

The quotation request is constructed by the B-partner and sent to Allianz’s platform as soon as all information required is collected. *eMagin*’s quotation engine analyses the context, and based in the offer configurations, proposes in return one or more insurance offer that can be displayed for the end-customer to select and purchase.

2.2. Purchase Service

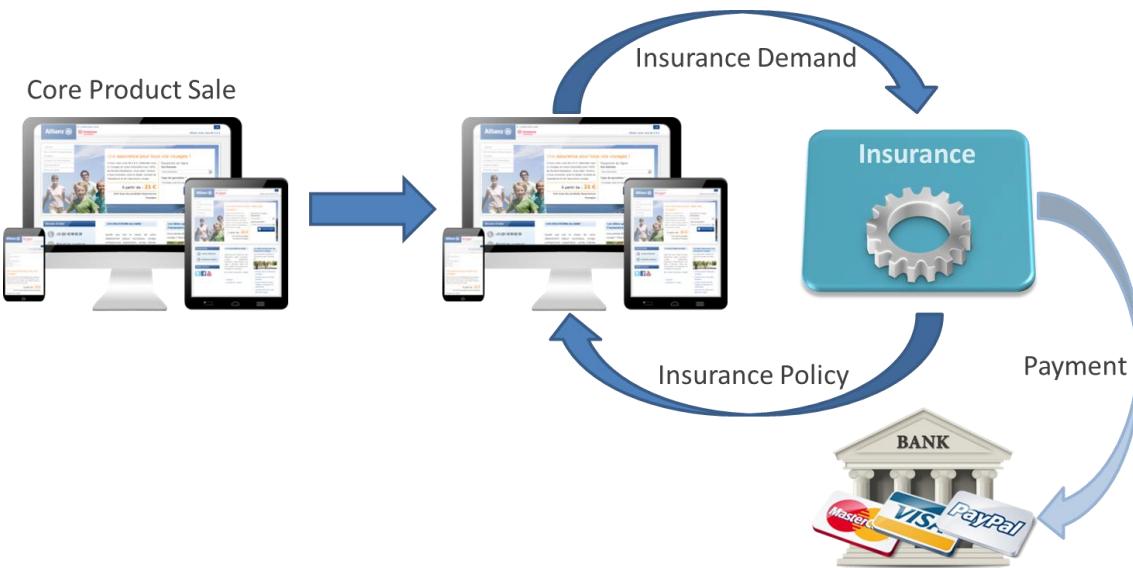

Purchase Service refers to the insurance purchasing of one or several selected insurance offers proposed during the quotation phase. Personal information on top of the context information is required to carry out a successful insurance subscription.

With payment:

The purchasing request is constructed by the B-partner and sent to AGA’s platform as soon as all information required (personal information & payment information) is collected, and payment has been processed by the partner for the core offer segment ONLY.

eMagin’s purchasing engine verifies the context against the offer configuration, processes the payment, and returns instantly a contract number that can be displayed in the B-partner’s confirmation page for the end-customer.

The e-commerce platform provides an insurance certificate through a confirmation e-mail sent to the customer.

3. COMMUNICATING WITH eMAGIN WEB SERVICES

eMagin web services are accessed using REST-like POST XML messages.

4. DATA SECURITY

eMagin – Allianz’s e-commerce platform – is PCI-DSS Level 1 compliant. See <https://www.pcisecuritystandards.org/> for detailed information.

Defined by the Payment Card Industry Security Standards Council, the standard was created to increase controls around cardholder’s data to reduce credit card fraud via its exposure. Validation of compliance is performed annually by an external Qualified Security Assessor (QSA) that creates a Report on Compliance (ROC) for organizations handling large volumes of transactions (ref: “PCI Security Standard Councils”).

The platform is currently connected to major global payment service providers for payment processing with credit cards.

While the list of cards accepted is market-specific, in general, the following cards are supported:

- Visa
- Master Card
- American Express

5. DATA FORMAT

5.1. Date and Time

All date, time and date-time data format use the corresponding standard XSD format definitions – see <http://www.w3.org/TR/xmlschema-2/> for XML Schema standard data definitions.

Date format pattern is: yyyy-mm-dd (Z | zzzzzz) ? where:

- `yyyy` is the four digits numeral that represents the year.
- `mm` is the two digits numeral that represents the month.
- `dd` is the two digits numeral that represents the day.
- Optional: `z|zzzzzz` represents the time zone. It can be expressed using one of this two options:
 - `z` is the symbol for UTC time zone.
 - `zzzzzz` define the time zone duration: `(+|-)hh:mm`.

Time format pattern is: `hh:mm:ss(.s+)?(z|zzzzzz)?` where:

- `hh` is the two digits numeral that represents the hours.
- `mm` is the two digits numeral that represents the minutes.
- `ss` is the two digits numeral that represents the whole seconds.
- Optional: `.s+` is the digits numeral that represents the fractional seconds.
- Optional: `z|zzzzzz` represents the time zone. It can be expressed using one of this two options:
 - `z` is the symbol for UTC time zone.
 - `zzzzzz` define the time zone duration: `(+|-)hh:mm`.

Date time pattern is the combined pattern of date and time, separated by the `T` letter: `yyyy-mm-ddThh:mm:ss(.s+)?(z|zzzzzz)?`

Examples:

- Date
 - 2015-04-23 – April 23rd 2015 in undefined time zone.
 - 2015-04-23Z – April 23rd 2015 in UTC time zone.
 - 2015-04-23+01:00 – April 23rd 2015 in CET (Central European Time, UTC +1 hour) time zone.
 - 2015-04-23-05:00 – April 23rd 2015 in EST (Eastern Standard Time, UTC -5 hours) time zone.
- Time
 - 09:57 – 09h57 time in undefined time zone.
 - 09:57Z – 09h57 time in UTC time zone.
 - 09h57+01:00 – 09h57 in CET (Central European Time, UTC +1 hour) time zone.
 - 09:57-05:00 – 09:57 in EST (Eastern Standard Time, UTC -5 hours) time zone.

5.2. Numbers

The number data format uses the corresponding standard XSD format definition – see <http://www.w3.org/TR/xmlschema-2/> for XML Schema standard data definitions.

All numbers are formatted in the *INTERNATIONAL* format with no separation between the thousands, and a dot (".") used as decimal separator for decimal numbers.

5.3. Country, Language and Currency Codes

Country codes use the ISO-3166-1 alpha2 codification system – see http://www.iso.org/iso/country_codes.

Language codes the ISO-639-1 codification system – see http://www.iso.org/iso/home/standards/language_codes.htm.

Currency codes use the ISO-4217 codification system – see http://www.iso.org/iso/home/standards/currency_codes.htm.

5.4. Text Encoding

Preferred text encoding format is UTF-8 (No BOM) – see <http://www.unicode.org/>.

Even if exchanged messages are XML based and can be encoded in multiple texts encoding formats, other encoding formats are discouraged and should be reserved for special cases.

6. XML MESSAGES FOR QUOTATION SERVICE

6.1. Quotation Service Request Message Structure

Once the end-customer has selected the core offer, usually enough information has already been collected for an insurance quotation. The B-partner can thus construct the quotation request and send it to *eMagin's* Quotation Service end point.

6.1.1. XML Message Example

Legend	
	Technical information, common to both quotation and purchasing services messages sent to the <i>eMagin</i> platform.

6.2. Quotation Service Response Message Structure

Based on the context and the offer's configuration, *eMagin*'s quotation engine analyses and returns one or more offers in the response. The B-Partner can then parse and display the information on the web site accordingly.

6.2.1. XML Message Example

Offers and add-ons

Offers give a list of offers according to the quote request context. Add-ons can also be found to the offers.

Offers and add-ons are identified by a code that refers to an offer definition that gives descriptions and coverages. These information are used to be shown to the user interface.

Variant definitions can complete the offers.

7. XML MESSAGES FOR PURCHASING SERVICE

Once the payment succeeds for core offer, B-Partner can construct the purchasing request and send it to *eMagin's Purchase Service end point*.

7.1. Purchase Service Request Message Structure

7.1.1. XML Message Example

Legend

Technical information, common to both quotation and purchasing services messages sent to the *eMagin* platform.

148	</purchaseRQ>	

Note: If Allianz partner is not accepting payment, the “paymentCard” block should not be sent. Instead of PaymentCard, “externalPayment” block can be sent.

1	<externalPayment>	Payment provider information.
2	<providerTransactionId>HKSCBTRV20180403000601</providerTransactionId>	Payment provider transaction id for purchase request.
3	<providerAccountId>ELVIA </providerAccountId>	Optional tag specifying provider payment account identification.
4	<providerCode>34855 </providerCode>	Optional tag specifying provider identification.
5	</externalPayment>	

Purchases

Element purchase can be repeated to subscribe several policies in the same request. One purchase will generate one policy number.

Holders and references

Purchase request define a purchaseHolder. This holder is the default if purchase element do not define policyHolder element.

This purchaseHolder can be reference by other nodes to avoid repeating the same information in the request. For example, paymentHolder node reused the purchase holder definition by using the element holderRef@refId which use the same purchase holder id.

7.2. Purchase Service Response Message Structure

7.2.1. XML Message Example

Legend

Information provided by Allianz to the B-Partner (fixed default values).

Information provided by the B-Partner specific to each service message (depending of customer information or input)

 Optional element

L.	Code Example	Comment
1	<?xml version="1.0" encoding="UTF-8"?>	
2	<purchaseRS version="2.1" xmlns="http://www.allianz.com/emagin/api/v2.1">	Purchase Service response root element.
3	<status code="Success" />	Purchase Service message treatment status. Possible values: • success • failure
4	<transactionId>CAM917094098187640988309872</transactionId>	This purchase message treatment identifier.
5	<messages>	Additional messages for information.
6	<message code="INFO1" level="Info">Informative message 1</message>	
7	</messages>	
8	<purchases>	
9	<purchase id="1">	
10	<contractNumber> AMDFR0100002964 </contractNumber>	Insurance policy contract number. Set if the purchase status is Success
11	<status code="Success" />	
12	<messages>	Additional messages for information.
